

M. Farooq

Columbia Station, OH 44028 | +12098890580 | farooqkiyani.engr@gmail.com

Professional Summary

• Senior engineer who's been doing this for 10 years and still finds it interesting. I work across the full stack Java Spring Boot and Python FastAPI on the backend, LangGraph agents and RAG pipelines for AI, React and Next.js on the frontend, Terraform for infrastructure that behaves the same in every environment. I've shipped systems that handle millions of events daily, AI pipelines that actually replaced human workflows, and cloud platforms across AWS, Azure, and GCP. I write code I'm not embarrassed by, build teams that ship without drama, and leave every codebase better than I found it.

Work Experience

Senior Software Engineer

FIT Technologies | Cleveland, OH

January 2022 to Present

- Architected the unified backend Spring Boot 3.x for core services, Micronaut for latency-sensitive paths, Quarkus for serverless, Python FastAPI for AI inference all on Kubernetes with gRPC inside and GraphQL Federation outside. Millions of requests daily, uptime that doesn't need weekend check-ins.
- Built a LangGraph multi-agent system for enterprise document automation: stateful graphs, tool-calling, persistent memory, human checkpoints where they actually matter. Thousands of workflows a day, manual review time cut substantially, engineers are no longer the bottleneck.
- Shipped production RAG with LangChain, hybrid search across Pinecone, Weaviate, and Qdrant, GPT-4o and Claude 3.5 Sonnet as the reasoning layer. Users started finding answers themselves — support ticket volume fell noticeably.
- Manages all AWS and GCP infrastructure in Terraform and Pulumi — EKS, RDS Aurora, Lambda, SageMaker, EventBridge. Nothing gets clicked into existence; every change is a reviewed PR. Provisioning: days to minutes.
- Wired up GitOps with ArgoCD, GitHub Actions, and Flux — Terraform plan on PR, apply on merge, canary rollouts with auto-rollback. Deploys went from something people feared to something nobody noticed.
- Delivered Next.js 14 frontends with App Router, React Server Components, TanStack Query, and Shadcn/UI three product teams, one design system, Core Web Vitals consistently green.
- Built real-time event pipelines with Kafka 3.x, Kinesis, and Flink, consumed by Python FastAPI and Django 5.x services. Millions of events daily at sub-100ms end-to-end with no data loss.
- Instrumented the entire stack — Java and Python — with OpenTelemetry, Prometheus, Grafana, and Datadog APM. Distributed traces everywhere, alerts that fire when something's actually wrong, MTTR down significantly.
- Trained and deployed an AI recommendation engine on SageMaker with PyTorch 2.x, Hugging Face Transformers, and MLflow. Blue/green model swaps, experiment tracking, measurable lift on engagement and revenue.
- Added Infracost to Terraform PR pipelines every infra change shows its monthly cost before merge. Cloud spend fell substantially, no engineering-wide cost postmortem required.
- Shipped Cloudflare Workers and Lambda@Edge with WebAssembly compiled from Rust. P95 latency dropped across every region without touching the core services.

Senior Full Stack Developer

Emprise Technologies | Toledo, OH

June 2018 to December 2022

- Delivered Spring Boot and FastAPI backends with React, Angular, and Vue.js frontends for a high traffic enterprise SaaS platform large user base, strong availability, on call shifts that stayed quiet.
- Decomposed a legacy Java monolith into 15+ domain aligned microservices on Kubernetes with Istio service mesh. Teams shipped on their own schedule, infrastructure costs dropped, no more queuing behind a shared pipeline.
- Replaced Azure click-ops with Terraform AKS, Azure SQL, Service Bus, App Service, all of it. Reproducible environments, zero config drift, every change code reviewed before it reached prod.
- Moved AWS workloads to CDK ECS Fargate, Lambda, RDS Aurora with multi-region failover built in from day one, not bolted on after an incident forced the conversation.
- Built Python FastAPI and Django ETL services with Celery workers and Redis queues observable, retryable, actually testable. Finally retired the overnight scripts everyone was afraid to change.
- Shipped Vue 3 apps (Composition API, Pinia, Vite) and React SPAs (TanStack Query, Zustand) across several parallel client engagements. Fast to build, easy to hand off.
- Built a PyTorch / OpenCV / YOLOv3 vision pipeline for automated QA inspection high accuracy, fully automated, real cost savings over the manual process it replaced.
- Hooked up Azure AI Services Computer Vision, Form Recognizer, Cognitive Search to automate document and invoice workflows. Took a large pile of manual data entry off the team's plate.
- Stood up a GraphQL Federation gateway with Apollo Router across Java microservices. Frontend teams got a single clean API and stopped filing tickets requesting new REST endpoints.
- Built a Spark / Databricks / dbt analytics platform on Snowflake and BigQuery. Stakeholders actually used it to make decisions the only benchmark that counts.

Senior Frontend Engineer

PRI Talent | Remote

July 2016 to May 2018

- Built React and Angular SPAs with Flux state management, WCAG compliance, and Lighthouse scores that held up back when most teams were still gluing jQuery plugins together and crossing their fingers.
- Migrated JSP/Servlet apps to React and Angular. Page load times dropped substantially and engineers finally stopped treating those repos like a live minefield.
- Shipped a shared TypeScript component library with Storybook docs, set up Jenkins and Travis CI, automated E2E tests with Selenium and Protractor. Deployment cycle time came down, fewer things broke in production.
- Trimmed bundle sizes through code splitting, lazy loading, and minification. Meaningful Core Web Vitals gains no framework rewrite, no drama.

Education

Computer Science (Bachelor's degree)

Bahria University | Islamabad

December 2012 to December 2016

Skills

SDLC	Jenkins	PHP	OOP	AWS	JavaScript	GraphQL	Vue.js	Web design	JSON	NoSQL
GitLab	React Native	React	GitHub	Jira	Back-end development	UNIX	APIs	Spring MVC		
Kubernetes	Kafka	TypeScript	.NET	MySQL	AI	Front-end development	Agile	MongoDB		
CSS	Python	SQL	jQuery	Java	Azure	Spring Boot	ASP	Cloud development	XML	Angular
REST	HTML	WordPress	Docker	CI/CD
